Support PF! An object may also have energy by virtue of its position. An incandescent light bulb is an example. Tipler, Paul A. Any living organism relies on an external source of energy – radiant energy from the Sun in the case of green plants, chemical energy in some form in the case of animals – to be able to grow and reproduce. The implications of this statement for cosmology – in particular, for the motion of the celestial spheres, which derive their eternal motion ultimately from the "first mover" in accordance with the axiom "all things that are in motion must be moved by something else" – called for further clarifications. Noether's theorem states that any differentiable symmetry of the action of a physical system has

a corresponding conservation law.

JevonsparadoxCarbonfootprint. In order for work to be accomplished, there must be a displacement in space – or, in colloquial terms, something has to be moved from point A to point B.
