It specifies the name of the attribute and sets it to None. Keep in mind that DOM isn't good for large amounts of XML, but if your input is fairly small then this will work fine. This article and hopefully a couple of others that will follow is my humble contribution. We also don't need to use value to access the item's attribute value like we did. The registry is global, and any existing mapping for either the given prefix or the namespace URI will be removed. Eventually the small string is expanded to several gigabytes. Question feed.
